

****Rapid Rhythm Reader does not detect heart attacks.**

****Rapid Rhythm Reader does not replace ordinary medical care.**

****The purpose of Rapid Rhythm Reader is to evaluate heart rhythm recordings obtained from mobile devices in persons without feelings of chest, arm, or jaw discomfort, shortness of breath, severe weakness, uncomfortable heart pounding, dizziness, or passing out. *If you have any of these feelings, you should seek medical attention at once.***

About Rapid Rhythm Reader

Rapid Rhythm Reader (R3) is a mobile app that allows a user to obtain an interpretation of a heart rhythm recording. This recording is commonly obtained using a modern FDA-cleared recording device, such as the *Apple Watch*®. The interpretation is provided by a Board-Certified Cardiologist. The interpretation is intended to occur expeditiously and inexpensively.

The electrocardiographic recording (ECG) that is obtained with the Apple Watch is a remarkably easy and convenient measurement of ongoing heart activity. It is highly informative in most instances.

It is our opinion that the information provided by the recording can be further enhanced by the prompt oversight of a medical specialist who is highly trained in electrocardiographic analysis.

R3 is not a substitute for appropriate in-person or Telehealth care by a physician.

The information obtained from the ECG recording obtained from a wrist wearable device mimics one of the 12 leads—lead I— that is commonly obtained in a physician’s office. The classic 12 lead electrocardiogram provides substantially more information about the heart than does a single lead recording.

Nevertheless, as an instantly accessible method of assessing a heart rhythm at the time of the user’s choosing, the ECG from a wrist wearable device is unsurpassed. With R3, we hope to help maximize its performance and thereby further enhance its utility.
